

The new 80W Dulux L light system

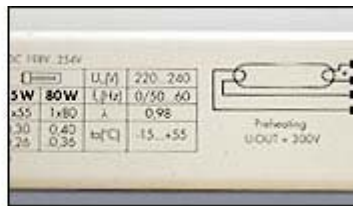

Lamp for plants in vivarium

Light is the most important factor for plants to grow and flower in the vivarium. Plants cannot grow when they receive a light-intensity of less than 1000 lux.

The 80 Watt Dulux L meets this criteria and has a very high intensity and a colour-spectrum as close as possible to normal daylight. This lamp is suited for very high vivaria up to 180 cm high and for plants which need a lot of light. With its length of 58cm you can calculate one lamp every 60cm in length of your vivarium.

We advise a row of lamps every 20cm in depth.

You need a electronic ballast in which case you do not need starters.

The electronic ballast will stay much cooler than the normal ones.

Replacement of the lamp in this combination should be done after 2½ years
