

Twilight Starter

Never again will your animals be shocked when the lights switch on and off. Your lighting can now possess the rhythm of the tropics.

Just change the starters in your light installation for these brand new high tech ones and see your lighting in your vivarium switching on in the morning at just 20% of the intensity and climbing to 100% in 30 minutes. It stays at 100% for 12 hours and after that time it dims down to 20% again in 30 minutes, at which level it remains until your timer shuts off the lighting. So you have an attractive light level in the evening too.

The Twilight starter is suitable to be used with a lot of fluorescent lighting, with a maximum of 36 Watt. It can especially to be used with Dulux L 24 and 36 Watt as well as Dulux F 36 Watt. You only have to change the starter; every tube needs one Twilight starter. It cannot be used with a electronic ballast, 2 fluorescent tubes in series connection or compensation capacitors.

When in doubt if it can be used with your lighting, email us and give exact specifications.
